

EdTech Analysis Project – Summary

By: Vamsi Krishna Hemanth and P. Manidheer Rao

My main contribution to the **EdTech project** was working on **Business Understanding, Data Cleaning, and the Power BI Dashboard**. During the Business Understanding stage, I explored the project requirements and identified the key objectives related to **student engagement, course completion, and dropout risk**. During the Data Cleaning process, I handled **missing values, duplicate Student IDs, inconsistent categorical values, special characters, date values, and numerical data** to prepare the dataset for analysis. One of the challenges I faced was deciding the appropriate method to handle different types of missing and inconsistent data. I also contributed to creating the **interactive Power BI dashboard** by developing KPIs, charts, and slicers to make the analysis easier to understand. I faced some challenges with Data Cleaning where data leakage happened while doing data cleaning and KPI calculations, data aggregation, slicer settings, and dashboard formatting, which I resolved through proper validation and Power BI configuration. Overall, this project gave me practical experience in understanding business requirements, preparing real-world data, and presenting meaningful insights through an interactive dashboard.
